Total 11 6656.3
```

# 12.43). The full model for the given problem is given below. Here we have used MINITAB to fit the required model.

```
The regression equation is y = 351 - 1.27 Oil Viscosity(x1) - 0.154 Load(x2) Predictor Coef SE Coef T P Constant 350.99 74.75 4.70 0.018 Oil Viscosity(x1) -1.272 1.169 -1.09 0.356 Load(x2) -0.15390 0.08953 -1.72 0.184 S = 25.4979 R-Sq = 86.2% R-Sq(adj) = 77.0% Analysis of Variance Source DF SS MS F P Regression 2 12161.6 6080.8 9.35 0.051 Residual Error 3 1950.4 650.1 Total 5 14112.0
```

# The restricted model for the given problem is given below. In this model we have restricted oil viscosity. The MINITAB output is as follows:

```
The regression equation is y = 400 - 0.231 \text{ Load}(x2) Predictor Coef SE Coef T P Constant 399.97 61.03 6.55 0.003 Load(x2) -0.23067 0.05636 -4.09 0.015 S = 26.0767 \text{ R-Sq} = 80.7\% \text{ R-Sq}(\text{adj}) = 75.9\% Analysis of Variance Source DF SS MS F P Regression 1 11392 11392 16.75 0.015 Residual Error 4 2720 680
```

Now we restrict the variable load to fit the restricted model. The MINITAB output for the fitted model is given below:

```
The regression equation is y = 228 - 2.86 Oil Viscosity(x1) Predictor Coef SE Coef T P Constant 227.83 26.01 8.76 0.001 Oil Viscosity(x1) -2.8560 0.8780 -3.25 0.031 S = 31.1112 R-Sq = 72.6% R-Sq(adj) = 65.7% Analysis of Variance Source DF SS MS F P Regression 1 10240 10240 10.58 0.031 Residual Error 4 3872 968 Total 5 14112
```

12.45). a) Now we have to fit a linear regression model including two indicator variables. Here we use MINITAB to fit the regression model to the given dataset. The output is as follows:

```
The regression equation is MPG(y) = -7.03 + 13.0 Z1 + 0.36 Z2 - 0.000038 Odometer + 0.337 Octane

Predictor Coef SE Coef T P

Constant -7.025 7.088 -0.99 0.333

Z1 12.985 1.115 11.65 0.000

Z2 0.358 1.061 0.34 0.739

Odometer -0.000037 0.00001 -2.37 0.028

Octane 0.33735 0.08380 4.03 0.001

S = 2.17777 R-Sq = 90.5% R-Sq(adj) = 88.6%

Analysis of Variance

Source DF SS MS F P

Regression 4 899.69 224.92 47.43 0.000

Residual Error 20 94.85 4.74

Total 24 994.54
```

From the above output we can observe that the adjusted r-square value is 88.6 i.e. approximately 89% of the variations in the response can be explained by the fitted model or the response variable. Also the p-value is less than the 0.05 level of significance. Hence the regression explained by the above model is significant.

b) From the above output we can see that the coefficient of Z1 is 12.985, it is regression coefficient of the categorical variable sedan. Hence we can say that the sedan appears to get the best gas mileage.

c) From the above output the coefficient of the Z2 is 0.358 which is very less when compared to the Z1. Hence we can say that they are not as good as sedan in gas mileage. Also its corresponding p-value is 0.739, which is more than the 0.05 level of significance. Thus, we can say that they are not significantly different.

#### 12.49)

## Best Subsets Regression: y versus x1, x2, x3, x4

## Response is y

			Mallows		х	х	х	х
Vars	R-Sq	R-Sq(adj)	C-p	S	1	2	3	4

4	99.1	98.2	5.0	0.86104	Х	Х	Х	Х

R-square corresponding to the model containing x2 and x3 is highest.

Hence the most suitable model for estimating the length of the infant is given below: Regression Analysis: y versus x2, x3

```
The regression equation is y = 2.18 + 0.958 \times 2 + 3.33 \times 3 Predictor Coef SE Coef T P Constant 2.183 2.801 0.78 0.465 \times 2 = 0.95758 = 0.05927 = 16.16 = 0.000 = 0.711383 = 0.2332 = 14.26 = 0.000 = 0.711383 = 0.99.1% = 0.711383 = 0.99.1% = 0.79.18 = 0.79.18 = 0.79.18 = 0.79.18 = 0.79.18 = 0.79.18 = 0.79.18 = 0.79.18 = 0.79.18 = 0.000 = 0.79.18 = 0.000 = 0.79.18 = 0.000 = 0.79.18 = 0.000 = 0.79.18 = 0.000 = 0.79.18 = 0.000 = 0.79.18 = 0.000 = 0.79.18 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.000 = 0.00
```

From the above output we can observe that the adjusted r-square value is 98.7%, i.e. this model can explain 99 % of the variations in the response.

12.51). a) MINITAB Model for  $\mu_{Y|x} = \beta_0 + \beta_1 x$ .

```
The regression equation is 
y = -587 + 428 x
Predictor Coef SE Coef T P
Constant -587.2 595.2 -0.99 0.343
x 428.43 54.41 7.87 0.000
S = 1051.22 R-Sq = 83.8% R-Sq(adj) = 82.4%
PRESS = 18811057 R-Sq(pred) = 76.99%
Analysis of Variance
Source DF SS MS F P
Regression 1 68505327 68505327 61.99 0.000
Residual Error 12 13260648 1105054
Total 13 81765975
```

From the output we noticed that the adjusted r-square value is 82.4 i.e. approximately 82% of the variations in the response can be explained by the fitted model. We can say that the fitted is model is good for prediction.

```
b). MINITAB Model for \mu_{Y|x} = \beta_0 + \beta_{1x} + \beta_{11}x^2. y = 1180 - 192 \ x + 35.2 \ x^2 Predictor Coef SE Coef T P VIF Constant 1180.0 544.0 2.17 0.053 x - 191.7 \ 143.5 - 1.34 \ 0.209 \ 17.8 <math>x^2 = 35.209 \ 7.915 \ 4.45 \ 0.001 \ 17.8  S = 656.287 R-Sq = 94.2% R-Sq(adj) = 93.2% PRESS = 8706974 R-Sq(pred) = 89.35% Analysis of Variance Source DF SS MS F P Regression 2 77028141 38514071 89.42 0.000 Residual Error 11 4737834 430712 Total 13 81765975
```

For this quadratic model the adjusted r-square value is 93.2 i.e. approximately 93% of the variations in the response can be explained by the above regression equation. This model is also good for estimating the response values for the given values of predictors.

c) The second model i.e. the quadratic model is more preferable than the first model (simple regression model) because its residual sum squares (s^2) and PRESS are less whereas coefficient of determination (R^2) value is greater than the simple linear regression model.

12.55).

a) Here we use SAS technology to fit the regression model for all possible models.

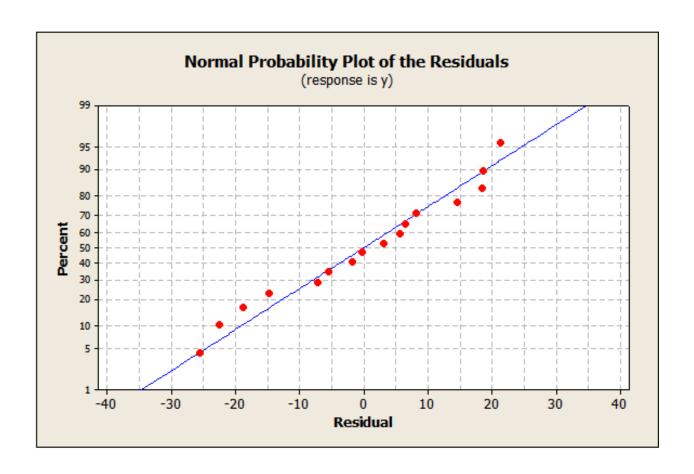

output is

Model C(p) R-Square MSE Variables in Model

```
1 0.0932 0.0614 319.28718 x3
